

■ BEATVIBE – Modern Music Player with Playlists and Mood Themes

Aim

To design and develop an interactive, mood-reactive music player web application named BeatVibe, which allows users to play songs, create playlists, and experience theme changes based on their selected mood.

Abstract

BeatVibe is a futuristic music player web app that fuses music, mood, and motion. It allows users to listen to songs, organize playlists, and switch between personalized mood themes such as Chill, Party, Focus, and Romantic. Each mood changes the website's background gradients, color tones, and animations, creating an immersive experience. The platform uses HTML, CSS, and JavaScript for the frontend, with Local Storage for saving user preferences and playlists. The project demonstrates how creative UI design, front-end programming, and user emotion mapping can merge to produce a visually dynamic and personalized music player interface.

Objectives

- Create an elegant and responsive music player interface. - Allow users to manage songs and playlists. - Dynamically alter theme and animation based on user mood. - Implement interactive controls (play, pause, next, previous, shuffle). - Integrate Local Storage for saving playlists and preferences.

Modules

1. Home Page – Welcomes the user with animations and an 'Enter the Vibe' button. 2. Music Player – Central player UI with controls and mood-based color themes. 3. Playlist – Create and save playlists using Local Storage. 4. Settings – Theme and mode preferences with reset options.

Algorithm

1. Start 2. Load Home Page 3. On button click, open player UI 4. Display songs list 5. Detect play/pause actions 6. Update progress and visuals 7. Change mood themes dynamically 8. Save data in Local Storage 9. Retrieve preferences on reload 10. End

Technologies Used

HTML, CSS, JavaScript, Tailwind CSS, Framer Motion, Lucide-react icons, Local Storage

Design Features

- Neon glow and glassmorphism UI - Responsive layout - Animated mood backgrounds - Waveform music visualizer - Smooth transitions

Result

The project successfully implements a modern, interactive music player that personalizes the user experience based on mood themes with persistent data storage using Local Storage.

Conclusion

BeatVibe demonstrates how frontend web technologies can merge with emotional computing to create a responsive, visually rich, and immersive music experience.

Future Enhancements

- Integrate Spotify API for real songs. - Add AI Mood Detection. - Include Lyrics Display. - Voice control support. - Multiplayer listening mode.
